TITLE: On a more precise method of mapping the number of lightning flashes

SOURCE: Leningrad. Glavnaya geofizicheskaya observatoriya. Trudy, no. 188, 1966.
Atmosfernoye elektichestvo (Atmospheric electricity), 3-10

TOPIC TAGS: atmospheric electricity, thunderstorm activity, lightning, ~~lightning~~
~~weather map~~ WEATHER MAP

ABSTRACT: The paper discusses improved methods for mapping the geographical density of lightning flashes. Lightning discharge counters with a known effective registration radius (defined as the maximum one within which all discharges are registered), were used. An expression for the effective radius, derived for wide band (2-20 kc) counters from a previously published (referenced) paper of L.G. Makhotkin, was too sensitive to its coefficient's errors; therefore, simultaneous registration with a narrow band (56-62 kc) counter was employed. Thunderstorm activity was expressed as the monthly number of discharges per 100 km² of the recording station vicinity area. Thunderstorm activity over the North Atlantic has been also evaluated from British MGG and MGS (unreferenced) radiolocation data. Dependence of thunderstorm activity, in

Card 1/2

ACC NR: AT6014848

form of number of discharges per 100 km^2 per month and also number of days with thunderstorms per month, - vs. a temperature-humidity index "te" was determined and established. The temperature-humidity index chosen was represented by the product of the temperature in $^{\circ}\text{C}$ x absolute humidity in millibars. Comments on further development are given. TITLE: The problem of the nature of the nondislocation etch pits
in germanium

SOURCE: Kristallografiya, v. 10, no. 4, 1965, 580-582

TOPIC TAGS: germanium, etched crystal

ABSTRACT: New data were obtained on the nature of the "little" etch pits in germanium. The investigation showed that these etch pits appear more readily when the etching time with a solution of 12 g KOH and 8 g $K_3 [Fe(CN)_6]$ in 100 ml water is increased to 5 or 6 min, and if a piece of germanium is allowed to boil for several minutes in the etchant prior to its use for etching. In addition, the crystals must be oriented precisely along [111] before the etching. The

Card 1/2

L 64789-65

ACCESSION NR: AP5018732

4

"little" pits appear extremely elongated if the orientation is 4--5° off [111] and do not appear for larger deviations. Unlike dislocation pits, the "little" pits reach a maximum with increasing etching time and then disappear. This fact, together with comparison of ordinary and dislocation-free germanium and comparison of pit densities before and after quenching and annealing, led to the conclusion that the "little" pits are due to accumulations of point defects. Orig. art. has: 3 figures and 1 table.

The method of the triangular system of coordinates in colloid chemistry. III. Peptization of ferric hydroxide by alkaline solutions of mannitol. A. DUMANSKII AND V. M. MIRONOVA. *J. Gen. Chem.* (U. S. S. R.), 20 (1941), cf. C. A. 25, 2145. To a suspension of $\text{Fe}(\text{OH})_3$ (contg. about 0.02 g. Fe_2O_3 per cc.) were added water, 0.2 M mannitol and 0.5 N NaOH, so that the total vol. of the mixt. was the same in a given series of expts. The mixt. was next centrifuged, and the Fe content of the supernatant liquid detd. "Isopeptic lines" (lines of equal soly. of Fe_2O_3) were plotted on two triangular diagrams: H_2O -mannitol-NaOH and $\text{Fe}(\text{OH})_3$ (A)-mannitol (B)-NaOH (C). On the second diagram, the zone of complete peptization extends from C to about the middle of CA, and from there to a point on CB that is about twice as distant from C as from B. Or, along the boundary line of this zone twice as much NaOH soln. is required as mannitol. Inside the zone, the relative amts. of the peptizers are not important. When a longer time (8 days) is allowed for the peptization, the concn. of NaOH has a greater effect on the amt. of dispersed $\text{Fe}(\text{OH})_3$. The increased peptization following an increase in alky. is of special interest since, as it will be shown in subsequent communications, CaCO_3 is also peptized by hydroxy compds. Bone formation and decalcification may thus be governed by the pH of body fluids. IV. Peptization of ferric hydroxide by sodium tartrate in alkaline solution. A. DUMANSKII AND Z. P. CHUMAKOVA. *Ibid.* 325-9.—The system $\text{Fe}(\text{OH})_3$ aq. Na tartrate aq. NaOH was studied in the same manner. The isopeptic lines converge toward the Na tartrate vertex, hence max. peptization occurs in the presence of small amts. of alkali and relatively large amts. of Na tartrate. Large amts. of sediment increase the soly. in the presence of excess Na tartrate and decrease the soly. when only small amts. of the

peptizer are available. The sep. influence of Na tartrate and NaOH is illustrated by "iso-tartrate" and "isoalk." lines. True solns. result when an excess of the tartrate is present. V. The system sugar-calcium carbonate-sodium hydroxide. A. DUMANSKI and G. R. VISHNIN. *Ibid* 620-4. - Suspensions of powd. chalk in alk. solns. of sucrose settle out more slowly in a sedimentometer and contain finer particles than similar suspensions in NaOH soln. or sugar soln. The particles are pos. charged, probably because of the ionization of the sucrose-Ca compd. formed in the surface layer. The compn. of the particle corresponds to $\text{CaCO}_3 \cdot \text{CaC}_{12}\text{H}_{22}\text{O}_{11} + \text{OH}^-$. The system aq. NaOH-aq. sucrose- CaCO_3 was studied by a procedure similar to that of previous investigations (cf. C. A. 28, 2345). In systems obtained by adding a year-old aq. suspension of CaCO_3 to solns. of sugar and NaOH the stability increases with sugar concn. With const. sugar concn. the max. stability is at pH 12.4-12.7. In suspensions of CaCO_3 obtained from CaCl_2 and Na_2CO_3 in the presence of both sucrose and NaOH, above certain concns. of NaOH clear solns. were immediately obtained. Also, the relatively stable suspensions became clear on standing in closed vessels, and crystals of $\text{CaCO}_3 \cdot 6\text{H}_2\text{O}$ appeared. Mannitol in alk. soln. also peptizes CaCO_3 and produces crystals of the carbonate on standing. The formation of the hexahydrate accounts for the hydrophilic properties of CaCO_3 suspensions. H. NIKENBERG

2

Physicochemical analysis of colloid systems. The peptization of ferric hydroxide by solutions of ferric chloride. A. DUMANSKI AND V. M. SIMONOVA. *J. Gen. Chem.* (U. S. S. R.) 1, 1229-44 (1931); cf. C. A. 26, 2007. The peptization of $\text{Fe}(\text{OH})_3$ by FeCl_3 was studied. Isopeptic lines (connecting compns at which the same amt. of $\text{Fe}(\text{OH})_3$ remained in stable suspension) were plotted on the triangular diagram $\text{Fe}(\text{OH})_3$, FeCl_3 , H_2O . Very large and very small amts of FeCl_3 decrease peptization. The isopeptic lines begin and end at the $\text{Fe}(\text{OH})_3$, FeCl_3 side. In the previous expts. with mixts of salts as peptizers the isopeptic lines were closed circles. The addn. of H_2O causes a continuous decrease in peptization by FeCl_3 . Similar studies were made of the system $\text{Fe}(\text{OH})_3$, FeCl_3 , electrolyte soln. The alkali chlorides prevented peptization; the restraining effect increased in the series $\text{K} < \text{Na} < \text{Li}$. A similar increase occurred in the series $\text{Ba} < \text{Sr} < \text{Ca} < \text{Mg}$. The coagulating power of alkali and alk. earth chlorides thus depends on the hydration of the cation. The system $\text{Fe}(\text{OH})_3$, FeCl_3 , LiCl soln. is discussed as the type. The isopeptic lines are shifted toward the $\text{Fe}(\text{OH})_3$, FeCl_3 side. The lines of const. FeCl_3 content are S-shaped. Small amts of $\text{Fe}(\text{OH})_3$, in contact with large amts. of LiCl , adsorb FeCl_3 from the soln. although no peptization occurs. Hence the total amt. of Fe in the supernatant liquid decreases, an effect termed by D. "neg. peptization." AlCl_3 , although itself a peptizer of $\text{Fe}(\text{OH})_3$, hindered the peptization by FeCl_3 . Wherever neg. peptization occurred, washing the residue free from the electrolyte (AlCl_3 or LiCl) caused it to disperse. Hence the particles of $\text{Fe}(\text{OH})_3$ in such mixts. acquire, by adsorbing FeCl_3 , an "ionogenic complex" whose ionization is prevented by AlCl_3 or LiCl , resp. The soln. obtained in the presence of AlCl_3 aged rapidly. The peptizing action of various anions (used as their Na salts), when added to $\text{Fe}(\text{OH})_3$, FeCl_3 mixts., is in the order $\text{NO}_3 > \text{Cl}$ and $\text{Br} > \text{F} > \text{SO}_4$. Of these, the NO_3 ion aids peptization, while the remainder exert a hindering effect. The sulfate is a particularly strong antipeptizer in small concns. When present in large concns., peptization occurs readily, but the resulting sols are colored yellow; the isopeptic curves are closed, as in a complex peptizer. H. SOYERHOF.

Velocity of decomposition of hydrogen peroxide by means of ferric salts as an indicator of their degree of hydrolysis. I. S. TELBYTOV AND V. M. SIMONOVA. *Doklady Akad. Nauk SSSR* 6, Sci. part, 75-78 (in German) 91 (2) 1931. Decomposition of H_2O_2 by $Fe(NO_3)_3$, $FeCl_3$ and $Fe(NH_4)_2(SO_4)_2$ is of the 1st order. The relative activity of the 3 salts is $Fe_2(SO_4)_3 > FeCl_3 > Fe(NO_3)_3$. Decomposition of H_2O_2 by means of ferric salts is intimately connected with hydrolysis so that when, e.g., $FeCl_3$ is added to the soln. the decomposition velocity constant increases gradually as $FeCl_3$ becomes hydrolyzed until it reaches a maximum at equilibrium. Decomposition of H_2O_2 is governed not by salt mols. or ions but by the microheterogeneous surface of $Fe(OH)_3$. Thus only hydrolyzable salts promote decomposition of H_2O_2 . In this way, the decomposition velocity constant for the same salt concn. of Fe of a given ferric salt is a measure of the relative hydrolysis of the salt. S. I. MARONSKY

ASB SEA METEOROLOGICAL LITERATURE CLASSIFICATION

USSR

1. Dynamics of electrolyte action in coagulation. I. Coagulation of iron hydroxide sol with acetates. V. M. Simonov and S. G. Telyakov. *Trudy Nauch.-Issled. Inst. Khim. Khark. Univ.* 10, 126-33 (1963); *Khark. Zhur., Khim.* 1954, No. 3:670. The effect of accompanying cations on the coagulation of dialyzed $\text{Fe}(\text{OH})_3$ sols by acetate was studied. On triangular diagrams sol-II, O, acetate (50 millimoles/l.) (total vol. was kept const.) 3 areas were observed: (1) stable sols, (2) coagulation setting in after 24 hrs., and (3) turbid sols, and ppts. formed immediately after combination of the liquids. The concn. of $\text{Fe}(\text{OH})_3$ was 2.4 g./l. (computed as Fe_2O_3) and the concn. of alkali metal ions was 10 millimoles/l. The exptl. results show that the coagulating action in the series $\text{LiOAc} < \text{NaOAc} < \text{KOAc}$ increases. This permits arrangement of the cations in decreasing order of their effect on the coagulating ability of the union in a series: $\text{Li}^+ > \text{Na}^+ > \text{K}^+$. For alk. earth metals (concn. 8 millimoles/l.) an analogous series was obtained $\text{Mg}^{++} > \text{Ca}^{++} > \text{Ba}^{++}$. Co acetate had a slightly stronger coagulating effect than did Ni acetate. Addn. of $\text{Cu}(\text{OAc})_2$ (80 millimoles/l.) changed the reddish brown color of $\text{Fe}(\text{OH})_3$ sol to olive color, and at a concn. of 200 millimoles/l. the color changed to intense green. After these systems stood for 1 year neither ppt. nor turbidity could be observed. It is assumed that under such

TITLE: Technical and economical production indices in syphon and top casting of rimming steel for cold-rolled sheets

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 4, 1962, 48, abstract 4V283
("Sb. nauchno-tekhn. tr. N.-i. in-t metallurgii Chelyab. sovmarkhoza",
1961, no. 3, 45-64)

TEXT: The authors compared quality indices of thin 08 KΠ (08KP) steel sheet production at all transitional stages: open-hearth shop, blooming mill, hot and cold rolling shop, and metal rejects at two consumer plants, i.e., the Magnitogorsk Metallurgical Combine where the steel is top cast and "Zaporozhstal" where it is syphon cast. It was established that the amount of waste sheets due to metal defects is approximately equal in both cases. However, at the "Zaporozhstal" Plant, the metal rejects due to lamination, are by 3.5 times higher at the consumer plant than at the MMK. Total labor consumption for preparing the amounts intended for teeming and finishing of metal at the MMK per one ton of ingots was by 0.068 man-hour less than at "Zaporozhstal". Total

Colloidal chemical characteristics of sugar beets. A. V. Dumanskii and I. P. Simonova. *Russ. ent. colloids* (Leningrad 1946, No. 1, 22-23; *Chem. Zvesti* 1946, 11, 1282). The method of Dumanskii (cf. *Zh. Khim. Neftepr.* 5, 501-511(1951)) was used for the detn. of col. colloids in sugar beets. In the 11 varieties of beets investigated the amt. of col. colloids varied from 2 to 3.72 g. per 100 g. sugar. The amt. of col. colloids further depends upon the influence of the various fertilizers, variation up to 42% being due to this factor. Since such great variation exists it is possible to obtain colloid-poor varieties by selection. M. G. Meure

28

Beet-sugar colloids. E. F. Simonova, *Gosudarst. Nauch.-Issledovatel. Inst. Kolloid. Khim. Tekhnol. Progress i Kontrol Pishchevoi Ind.* 1938, 45-57.—The Dinnanskii method (C. A. 28, 1245¹) for detg. colloids has been successfully applied to analysis and evaluation of raw products in the beet-sugar ind. It is particularly useful for studying relations between sol. colloid content of beet sugar products and external factors such as soil compn. (amt. and kind of fertilization), soil moisture and the like. A problem which needs further study is to ascertain the conditions under which the sol. colloids decrease in amt. Tabulated data show the influence of various fertilizer combinations and of soils in different (Russian) localities. It is noteworthy that Mg in the soil increases the content of sol. colloids in beet juice.

0
light. Chlorophyll formation was significantly poorer in the presence of red light than in green, yellow-orange, and yellow light. In determining the effect of different light spectral composition on chlorophyll levels in green barley leaves kept in the dark for 12-13 hrs, it was established that in all experiments with white light the level of chlorophyll a increases by 20-43% and the level of chlorophyll b increases by 23-54%. Pigments did not increase in infrared and red light. For green light, the level of chlorophyll a increased by 24% and of chlorophyll b by 17%. Yellow-orange light had practically no effect on the chlorophyll levels. It is concluded that the medium wave length range of the spectrum is most favorable for the chlorophyll formation process in etiolated and green barley sprouts. Ye. Yurin.

SOV/180-59-3-26/43

AUTHORS: Rauzin, Ya.R. and Simonova, Ye.Ya. (Moscow)

TITLE: The Change in Electrical Conductivity of Metals in the Zone of the Critical Degree of Deformation

PERIODICAL: Izvestiya Akademii nauk SSSR, Otdeleniye tekhnicheskikh nauk, Metallurgiya i toplivo, 1959, Nr 3, pp 136-139(USSR)

ABSTRACT: Experiments were first carried out on iron containing 0.06 C, 0.16 Si, 0.17 Mn, 0.015 P, 0.042 S. Samples were subjected to various degrees of deformation. By using different tempering temperatures, samples of different grain sizes were obtained. Fig 1 is a curve of the specific resistance against the degree of deformation. With small degrees of deformation there is a minimum in specific resistance. The decrease in specific resistance is less for coarse than for fine grained materials (Fig 2). The decrease may be explained by shrinkage in the metal. It is possible that "densification" occurs in the region where large amounts of vacancies, dislocations and other lattice defects occur, which causes an increase in electrical conductivity. The position of the minimum almost coincides with the critical degree of deformation. It

Card 1/2

SOV/180-59-3-26/43

The Change in Electrical Conductivity of Metals in the Zone of
the Critical Degree of Deformation

is proposed that the critical degree of deformation is caused by the same reasons as the minimum in the electrical resistance curve. The decrease in electrical resistance confirms that slip lines exist at small degrees of deformation, although they cannot be seen under the optical microscope. Similar curves of electrical resistance against degree of deformation are produced by aluminium (Fig 4) and the steel EI-69 containing 0.46 C, 13.9 Cr, 14.3 Ni, 2.3 W (Fig 5). There are 5 figures and 12 references, 9 of which are Soviet and 3 German.

AUTHORS: Filippov, L. P.; Simonova, Yu. N.

TITLE: Measurement of thermal conductivity of metals at high temperatures. I. Measurement of small differences of high temperatures

SOURCE: Teplofizika vy*sokikh temperatur, no. 1, 1964, 3-8

TOPIC TAGS: thermal conductivity of metal, high temperature thermal conductivity, differential optical pyrometer, micropyrometer, optical wedge, signal to noise ratio, measurement reproducibility

ABSTRACT: A simple differential optical pyrometer is described. It is based on the investigation of the temperature distribution along thin rods, tubes, and wires electrically heated to as much as 2000K, for the purpose of measuring the thermal conductivity of metals. The theory of the micropyrometer is briefly described. The micropyrometer has a sensitivity from 0.02 to 0.08° at temperatures from

Card 1/3

ACCESSION NR: AP4024185

1300 to 2300K. The sensitivity is determined principally by the minimum displacement of the optical wedge necessary to produce a noticeable change in the output signal. The signal to noise ratio is approximately 5×10^{-4} for the entire range of temperatures. The reproducibility of the measurements is within 0.1°, and the equipment is not very sensitive to the focusing of the objectives. A detailed description will be published elsewhere. "We take the opportunity to thank V. A. Zamkov for many consultations which were very useful to us during the initial stage of the work." Orig. art. has: 4 figures, 8 formulas, and 1 table.

TITLE: Measurement of thermal conductivity of metals at high temperatures. II. Procedure for thermal conductivity measurements

SOURCE: Teplofizika vy*sokikh temperatur, v. 2, no. 2, 1964, 188-191

TOPIC TAGS: thermal conductivity, pyrometer, temperature detector, metal physical property, temperature gradient, temperature measurement

ABSTRACT: This is a continuation of a paper by the authors (Teplofizika vy*sokikh temperatur v. 1, no. 1, 1964) in which they described a simple differential pyrometer to measure small differences of high temperatures and their distribution over small areas on the object. The present article is devoted to the use of this instrument for the measurement of the thermal conductivity of metals at tempera-

Card

1/3

ACCESSION NR: AP4038433

tures on the order of 2,000° and above. The gist of the method consists of investigating the distribution of the temperature along a wire or a foil heated with current, near a region with constant temperature, i.e., in the region where the temperature distribution is exponential. Although measurements of this type were first performed by Krishnan and Jain (Proc. Roy. Soc. v. A225, 1160, 1954 and Brit. J. Phys. v. 5, no. 12, 426, 1954) this is the first detailed description and analysis of the procedure. An analysis of the heat conduction equations for the foil heated by current in vacuum shows that to determine the temperature distribution it is not necessary to know the absolute values of the temperature differences but their ratios. This permits measurements to be made without calibration of the differential optical pyrometer. The influence of the finite dimensions of the investigated sections of the wire or foil is not decisive, nor is the degree of blackness of the investigated sample. Another advantage of the method is that the change in temperature on the investigated section can be produced artificially by

Card 2/3

ACCESSION NR: AP4038433

means of a wire rider. The procedure proposed was investigated with foil ribbons and wires of tungsten heated in a vacuum chamber. The results were reproducible within 2% and the values of the thermal conductivity obtained under different conditions were accurate within 6%, and agreed fairly well with results obtained by others. It is emphasized that the procedure is simple, sufficiently accurate, and can be readily used at temperatures above 2,000°. Orig. art. has: 1 figure, 6 formulas, and 2 tables.
